Scrying

.^(type %gx /ship/desk/case/path/mark)

The return type.

The data returned by the scry will be cast to this type. The scry will fail if the data does not nest in this type.

Ship

Always our ship because remote scries are not yet supported.

Vane

- **a** Ames
- **b** Behn
- C Clay
- d Dill
- **e** Eyre
- g Gall
- i Iris
- j Jael

Care

The kind of request.

One of:

a b c d e f p s r t u v w x y z

- Usually x, meaning "read".
- Sometimes **y**, meaning "directory listing" or the equivalent.
- Occassionally u, meaning "existence check".
- The rest are mostly particular to Clay.
- Jael never takes a care.
- Evre sometimes doesn't take a care
- The rest of the vanes take a care.

Case

- For Clay scries this allows you to specify a desk revision to target. The case may be an absolute time, a revision number or a label. The leading %da, %ud or %tas is omitted.
- For all other vanes and agents, this is always the current time.

Desk, agent or tag.

- For Clay this is the target desk, e.g. %home.
- For Gall this is the target agent, e.g. %graph-store.
- For Jael, this is a tag which specifies the scry endpoint, e.g %code.
- Sometimes this is a tag for Eyre too, other times it is empty.
- This is always empty for Ames, Behn, and Dill.

Path

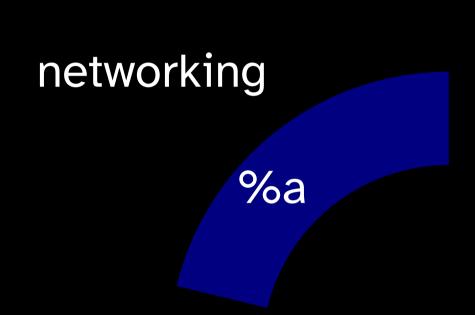

This is the actual scry path. It will be different for each endpoint.

/foo/bar/baz

Mark

- This is only used for Gall agent scries with a care of x. It is omitted entirely in all other cases.
- For a Gall agent x scry, Gall will attempt to convert the mark returned by the endpoint to the mark you specify here. The scry will fail if the mark conversion fails.
- Most often just %noun.

Ames

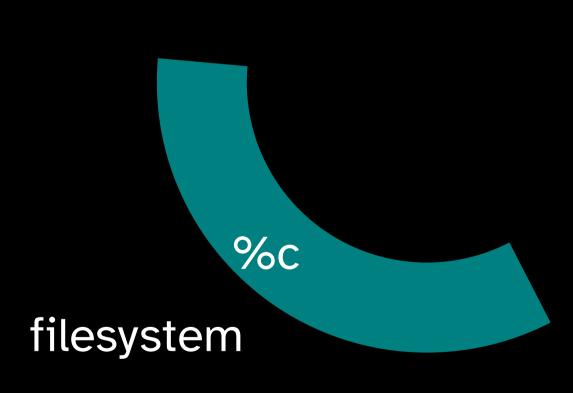

- UDP packets
- end-to-end encryption
- routing, congestion control

Behn

timer %b

- timer priority queue
- guaranteed notification after wakeup time

Clay

- typed filesystem
- all files have marks
- referentially transparent
- version-controlled
- global namespace
- 2 GB limit currently

Dill

- session and keyboard handler
- see Drum and Hood

terminal

Eyre

- HTTP API endpoints
- data subscription model preferred (JSON-based channels)
- cookie-based authentication
- MIME types are Arvo-level primitives

Gall

userspace

- persistent daemons
- standard form
- Gall brokers access to Arvo services
- communicates via Eyre

Iris

client vane for HTTP requests

client services

Jael

%j

cryptographic secrets

- verify identity
- track public keys(Azimuth state)
- communicate with sponsor

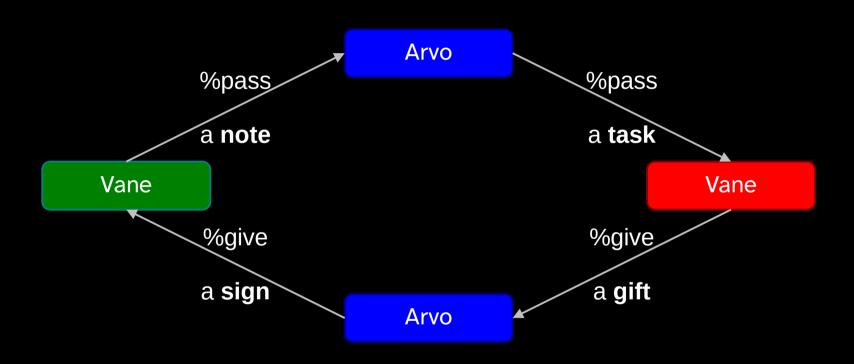

Khan

control plane

- external thread control plane
- brand new, likely to evolve
